

WHAT MAKES YOUR BIODYNAMIC FARM

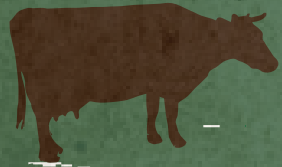

Salmon-Safe?

Demeter USA farm standard now incorporates “Salmon-Safe” guidelines to further protect water and wildlife.

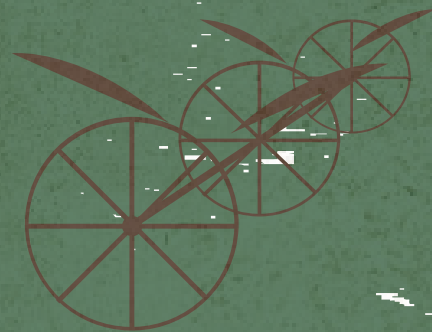

LIVESTOCK

Pastures managed to prevent erosion, fence livestock from waterways, intensive rotation grazing, native plants restored.

WILDLIFE

Upland habitat conserved and connected to riparian areas, invasive plants controlled, barriers to wildlife movement removed, habitat for birds, pollinators, other wildlife.

STREAMS

Streamside buffers in place, wetlands protected, stream habitat restored.

Demeter and Salmon-Safe jointly developed this overlay for Biodynamic growers by comparing Salmon-Safe’s certification program with the U.S. Biodynamic farm standard. Salmon-Safe requirements are now embedded in the Demeter certification standards and will be required for ongoing certification. West Coast Biodynamic growers will have the ability to use the Salmon-Safe label in sales and marketing.

WATER

In-stream flows maintained for fish, fish screens on irrigation diversions, water use monitored, conservation measures in place.
